

**Amendments to the Specification:**

Please replace the paragraph beginning at page 3, line 12, with the following rewritten paragraph:

- 5 -- The invention achieves the above-identified object by providing an electrical connector, into which a circuit board may be inserted. The electrical connector includes an insulation base, a plurality of first terminals arranged in the insulation base, and a plurality of second terminals arranged in the insulation base. The insulation base has a connection slot, into which the circuit board is inserted. The
- 10 connection slot has an upper edge formed with, from outside to inside, a slant first surface and a horizontal second surface, and a lower edge formed with, from outside to inside, a horizontal third surface and a fourth surface. An inner side of the connection slot is formed with a fifth surface. Each of the first terminals has an elastic contact, which has a protrudent connection point projecting over the
- 15 second surface and located within the connection slot. Each of the second terminals has an elastic contact, which has a protrudent connection point projecting over the third surface and located within the connection slot. A card-ejecting slant surface is formed between the second surface and the fifth surface in the connection slot, and the inserted circuit board is moved backward by a
- 20 distance along the card-ejecting slant surface ~~after-when~~ the circuit board is rotated to be horizontal. --
